

Bars 1-2 are scored on PREDICTED per-dispatch profiles, bars 3-4 on costs MEASURED by executing bar 2's schedule on the K1 (w4 394 dispatches, w5 492, every network bit-exact or within 1.8e-4). Stacked by network because the reveal moves misses between networks: w5's board re-cost introduces a fused_full band absent from the predicted bar beside it.
